

Farid Ahmadov

Senior Full-Stack .NET Engineer

akmedliov@gmail.com | +994 55 470 60 80 | linkedin.com/in/faridakhmadov

SUMMARY

Full-Stack Software Engineer more than 6 years of experience designing and building modern, scalable applications across web and enterprise platforms. Skilled in crafting clean architectures, implementing domain-driven solutions, and delivering high-performance systems. Worked on internal management platforms, reporting systems, and cloud-hosted enterprise tools that improved efficiency and data visibility across organizations. Strong in C, .NET, Node.js, React, Vue.js, SQL Server, MongoDB, REST APIs, AWS, Azure, Kafka and Docker. Passionate about code quality, DDD (domain-driven development), TDD (test-driven development) and everything mentioned in Technical Proficiencies section for creating smooth user experiences through well structured, maintainable solutions.

TECHNICAL PROFICIENCIES & SKILLS

C#, .NET / .NET Core, ASP.NET Web API, ADO.NET, Blazor, ASP.NET MVC, EF/EF Core, NHibernate, WPF (MVVM), WinForms, Strong experience on Microservices, SOLID, CQRS, Architecture patterns (DDD - Domain Driven Architecture, Event-Driven Architecture, Clean Architecture), TypeScript, Mobx, JavaScript(also experienced on ES6), NodeJS, React.js (NextJS, MaterialUI), Vue.js (NuxtJS), HTML, CSS, Bootstrap, MS/SQL, PL/SQL, MongoDB, Elasticsearch, Redis, Azure (App Service, AKS Kubernetes, Functions, Service Bus, Storage, Key Vault), GCP (Google Cloud Platform), Apache Kafka, AWS basics, Docker,SignalR, GitHub Actions, Azure DevOps (Pipelines/Repos), IaC (Bicep/Terraform basics),RabbitMQ, Hangfire, xUnit/NUnit, Integration/Contract tests, Playwright

PROFESSIONAL EXPERIENCE

Clever Compliance

Senior Full-Stack .NET Engineer

Apr 2023 – Present

Remote - Stockholm, Sweden

Key Contributions:

- Refactored a large legacy monolithic system into multiple .NET 8 microservices running on AWS EKS, using Elastic Load Balancing and CloudWatch for scalable and reliable deployments.
- Optimized MS SQL Server performance by refactoring slow queries, introducing proper indexing strategies, and leveraging execution plan analysis reducing critical report generation times from minutes to seconds.
- Improved database performance by combining ADO.NET for intensive queries with EF Core for CRUD operations, cutting average query times by nearly 90%.
- Implemented Redis caching and an outbox pattern to optimize performance and ensure reliable asynchronous communication between services.
- Rebuilt several core modules with React + TypeScript using Mobx for state management, improving responsiveness and reducing user task times by about 30%.
- Built internal WPF (MVVM) utilities with offline synchronization, speeding up validation and reporting workflows for the operations team.
- Set up CI/CD pipelines with GitHub Actions and AWS CodePipeline, integrating with S3, Lambda, and CloudFormation to support continuous delivery and infrastructure as code.
- Integrated Hangfire for background job scheduling and retry logic, enabling reliable processing of long-running tasks such as PDF generation, email notifications, and compliance batch jobs.
- Designed and implemented RabbitMQ-based messaging pipelines for inter-service communication, using topic exchanges and consumer acknowledgements to ensure fault-tolerant event delivery.
- Enhanced Redis usage by adding distributed locking and sliding-expiration caching strategies, preventing race conditions and significantly reducing load on core microservices.

ELFO is a software development company that provides custom ERP, CRM, and enterprise applications for global clients. The company collaborates with well-known brands such as Firmenich, Emerson, and Heinz, delivering tailored software solutions to improve their internal processes and operations.

Key Contributions:

- Worked as a Full-Stack .NET Engineer on multiple enterprise ERP and CRM systems, helping clients modernize legacy .NET Framework monolith applications into .NET microservice-based solutions.
- Integrated multiple third-party APIs and external enterprise systems (e.g., SAP, Salesforce) by building secure REST connectors and background synchronization jobs, ensuring reliable data exchange and seamless workflow automation.
- Modernized front-end components using React and Material UI, creating reusable UI patterns and improving overall UX consistency across core compliance modules.
- Containerized backend services and worker processes using Docker, improving deployment consistency, simplifying environment setup, and reducing onboarding and release time across multiple client projects.
- Redesigned core application architecture by applying key principles of Domain-Driven Design (DDD) by most importantly introducing clear domain boundaries, refining service responsibilities and improving long-term code maintainability.
- Implemented real-time capabilities using SignalR, enabling instant UI updates for dashboards, notifications, and workflow events across ERP and CRM modules, improving user responsiveness and reducing manual refresh actions.
- Led upgrades from monolithic systems to modular microservices, implementing RESTful APIs, asynchronous communication, and optimized service orchestration.
- Enhanced backend reliability through unit and integration testing, increasing automated test coverage to over 80
- Improved database performance by rewriting LINQ-to-SQL queries, optimizing stored procedures, and introducing indexing strategies that significantly reduced execution times.
- Managed and deployed applications on Microsoft Azure, leveraging App Service, Azure SQL, Key Vault, and Application Insights to ensure scalability, security, and observability.
- Contributed extensively to the React-based front end, implementing reusable components, improving state management (Redux, Context API), and optimizing rendering for large data-driven interfaces.

ROOF Academic Training*Full-Stack .NET Engineer***Nov 2020 – June 2021***Onsite - Azerbaijan*

Roof Academy makes in-house development on digital learning systems and internal tools for managing students and online lessons. I worked on building and deploying these platforms from the ground up using modern .NET and cloud technologies.

Key Contributions:

- Developed and maintained .NET backend services following Test-Driven Development (TDD) and Domain-Driven Design (DDD) principles to ensure clean architecture and high maintainability.
- Improved SQL Server performance by tuning NHibernate-generated queries, optimizing indexes, and implementing efficient transaction boundaries, resulting in faster lesson scheduling and student data retrieval operations.
- Implemented data access using NHibernate with SQL Server, optimizing complex stored procedures, queries, and transaction handling for better performance.
- Containerized backend services using Docker and deployed them on AWS ECS, integrating AWS RDS (SQL Server) and S3 for database hosting and file storage.
- Built RESTful APIs for real-time student, lesson, and exam management, including authentication and authorization layers.
- Designed and integrated React-based front-end components with optimized state management and API communication.
- Created an internal exam platform and implemented automated testing pipelines to maintain reliability across deployments.

- Configured CI/CD workflows with GitHub Actions for building, testing, and deploying containerized services to AWS environments.

CBM Engineering LLC

Full-Stack .NET Developer

Dec 2019 – Nov 2020

Onsite - Azerbaijan

CBM provides monitoring and diagnostic solutions for industrial equipment used in oil and energy companies. I was part of the engineering team that developed a cloud-based platform for real-time data acquisition, analysis, and reporting from monitoring devices installed on heavy industrial machinery.

Key Contributions:

- Developed and maintained robust web applications using .NET Core, React.js, and Vue.js, enabling clients to monitor live operational data and receive automated alerts.
- Designed complex stored procedures and database logic in SQL Server to handle large volumes of telemetry data efficiently.
- Implemented unit, component, and end-to-end (E2E) testing to ensure product stability and maintain high code quality.
- Deployed and monitored applications on Microsoft Azure, leveraging services such as App Service, Azure SQL, and Application Insights for reliability and performance tracking.

OUTSOURCE PROJECTS

ETLog

Senior Full Stack .NET Engineer

November 2025 – Present

Freelancer

Key Contributions:

- Re-engineered a monolithic robot management suite into a Modular Monolith using .NET 9, applying Domain-Driven Design (DDD) principles to ensure high cohesion and clear bounded contexts.
- Achieved strict loose coupling by implementing Strategy and Visitor patterns for robot command execution, effectively decoupling high-level business rules from hardware-specific implementations.
- Introduced a CQRS-based approach to handle complex robot telemetry, using Clean Architecture to separate read/write concerns and improve system maintainability.
- Optimized the data layer by combining EF Core for standard operations with raw SQL/ADO.NET for high-performance indexing and execution plan tuning, reducing database contention under heavy loads.
- Built a scalable, event-aware backend integrated with SignalR for real-time robot status updates and RabbitMQ to handle asynchronous command queuing between modules.
- Developed a modern fleet management dashboard using React, Next.js, and MaterialUI, leveraging TypeScript for type-safe state management and a seamless user experience.
- Hardened the system infrastructure using Docker and GitHub Actions for CI/CD, ensuring that the modular boundaries were enforced through automated Integration and Contract tests.

PERSONAL PROJECTS

Examinax LLC

Co-founder

Jan 2025 – ongoing

Hybrid - Azerbaijan

Examinax is an online exam simulation and preparation platform that I co-developed with a focus on scalability, reliability, and real-time user interaction. The platform delivers realistic testing experiences and supports thousands of concurrent sessions.

Key Contributions:

- Designed and implemented the backend using Node.js following Domain-Driven Design (DDD) principles to maintain clear separation between business logic and infrastructure layers.
- Applied Test-Driven Development (TDD) across critical modules to ensure reliability, prevent regressions, and improve development confidence.
- Built a Vue.js (Nuxt 3) user-facing web interface leveraging server-side rendering (SSR) to achieve strong SEO performance and faster first-load rendering.
- Developed the exam engine in React.js, enabling seamless navigation, dynamic question rendering, and real-time state synchronization during exams.
- Integrated heartbeat-based session management to track user activity and handle timeouts, reconnections, and abandoned sessions in real time.
- Utilized Redis for caching and session data management, significantly improving backend performance and reducing response time for frequent queries.
- Chose MongoDB as the main data store to handle nested and flexible data structures, optimizing for scalability and eliminating the complexity of relational joins.
- Deployed and maintained the system on cloud infrastructure with containerized services, ensuring fault tolerance and horizontal scalability.

EDUCATION

UNEC

Bachelor in Computer Science

Sep 2015 – Jun 2019

Baku, Azerbaijan

Code Academy

Software Engineering

Nov 2019 – Apr 2020

Baku, Azerbaijan
